Speed and Feed data found on page 283

## Troubleshooting

## General notes

All the cutting rate recommendations specified in this catalogue are standard values valid exclusively for new tools or tools re-ground to Guhring specifications. Pre-requisites are stable machines, optimal cooling, optimal tool clamping and maximum concentricity of the tool and the ma-
chine spindle. Our recommended cutting rates must be reduced if the conditions deviate. The values may also be adjusted to influence Surface finish quality, machining rate or tool life.

## 1. Workpiece clamping

Loss of tool life or tool breakage through unstable clamping
> improve workpiece clamping

## Alternative:

> reduce feed
$>$ reduce cutting width or depth

## 2. Tool clamping

Loss of tool life or tool breakage through unstable, worn or too small/long/thin tool holder
> apply new or larger tool holder or holder with increased clamping force and increased concentricity

## Alternative:

$>$ reduce cutting rates
reduce clamping length
$>$ apply tool with smaller diameter
> check clamping screws for wear

## 3. Surface finish quality

Excessive peak-to-valley height Ra/Rz at the tool Surface finish through excessive feed and feed rates or vibrations

- improve workpiece clamping and tool clamping (see points 1 and 2)

## Alternative:

$>$ reduce feed and feed rate
> increase cutting speed

## 4. Vibrations

High tool wear, insufficient workpiece Surface finish quality and insuf-
ficient dimensional accuracy through vibration
improve workpiece and tool clamping (see points 1 and 2)
increase tooth feed, because the chip centre thickness is too small
> modify speed
modify milling strategy, i.e. select alternative cutting distribution
change tool selection, i.e. reduce no. of teeth or spiral

## Troubleshooting

## 5. Chip congestion/cooling

Significant reduction in tool life, crumbling on cutting lips, edge build-up or conglutination of flutes through insufficient chip evacuation
> select milling cutters with internal cooling

## Alternative:

- peripheral cooling via GM 300 chuck
- increase volume flow
> adjust coolant flow
> apply compressed air cooling (according to tool and material)
$>$ reduce feed rate
> modify cutting distribution

## 6. Pecking when drilling

Significant reduction in tool life as well as crumbling of cutting lips through insufficient chip evacuation and thermal stresses
$>$ select milling cutter with internal cooling with drilling depths $>0.5 \times \mathrm{D}$ pecking in stages

## Alternative:

> peripheral cooling via GM 300 chuck

- increase volume flow
> adjust coolant flow
$>$ reduce feed rate

## 7. Thermal influence on materials

Through welding or torch cutting, the material characteristics at the parting line do not correspond with the specified material class
$>$ reduce cutting rates
> select tool for materials with a higher tensile strength

## 8. Entry in hardened materials

For entering materials over 44 HRC, reduce the feed rate $\mathrm{vf}(\mathrm{mm} / \mathrm{min})$ in accordance with the illustration on the right

## Troubleshooting

## 9．Loss in tool life with interrupted cutting

Significant loss in tool life through interrupted cutting （especially with milling angles of $90^{\circ}$ ）
－modify cutting distribution
＞reduce feed rate for entry and exit
$>$ reduce approach angle

## 10．Feed rate adjustment：Modifying the cutting width

$>$ when modifying the cutting width WOC，the feed rate must be reduced in accordance with the illustration on the right
$>$ cutting speed or revolutions remain unchanged
－double reduction applies when also modifying the cut－ ting depth DOC！

WOC $=1 \times D$
IPT＝ 25 \％

WOC $=0.5 \times D$
IPT＝ 50 \％

WOC $=0.25 \times \mathrm{D}$ IPT＝ 100 \％

## 11．Feed rate adjustment：Modifying the cutting depth

＞when modifying the cutting depth DOC，the feed rate must be reduced in accordance with the illustration on the right
＞cutting speed or revolutions remain unchanged up to cutting depths of $3 \times \mathrm{D}$ ，must only be adapted over $3 \times \mathrm{D}$
＞double reduction applies when also modifying the cut－ ting width ae！

$D O C=1 \times D$
IPT＝ 100 \％

DOC $=2 \times \mathrm{D}$
IPT＝ $50 \%$

DOC $=3 \times \mathrm{D}$ IPT＝ $25 \%$

## 12．Plunging strategies

for drilling：
$>$ reduce feed rate $\mathrm{v}_{\mathrm{f}}(\mathrm{mm} / \mathrm{min}$ ．）
$>$ additional pecking for drilling depths $>0.5 \times \mathrm{D}$ or tran－ sition to radial machining Attention：Danger of breakage through abrupt load increase！

## Oblique plunging up to $15^{\circ}$（preferred）：

$>$ reduction in feed rate $\mathrm{v}_{\mathrm{f}}(\mathrm{mm} / \mathrm{min}$ ．）not required

## Oblique plunging between $15^{\circ}$ and $30^{\circ}$ ：

－reduce feed rate IPT in accordance with the illustration on the right

## Helical plunging：

－for helical plunging on a milling cycle，we recommend a feed of 0.1 to 0.2 per cycle
$>$ reduce feed rate $\mathrm{v}_{\mathrm{f}}(\mathrm{mm} / \mathrm{min}$ ．）in accordance with the illustration on the right
$>$ select preferred hole diameter $1.8 \times \mathrm{D}$

$90^{\circ}$
IPT－70 \％

$\leq 15^{\circ}$
IPT＝ 100 \％

Helical plunging

## Troubleshooting

## 13. Copy milling

For cutting depths DOC $<0.5 x \mathrm{D}$, the engaged effective diameter $\mathrm{D}_{\text {eff }}$ must be applied to calculate the speed. With the spindle not engaged, the effective diameter is calculated according to the illustration below. To increase tool life, we recommend machining with tilted spindle. The tilt angle must be taken into account when calculating the effective diameter $D_{\text {eff. }}$

Modifying the cutting width WOC results in improved Surface finish quality of the workpiece (reduced peak-to-valley height)

$$
R_{\mathrm{th}}=\frac{D}{2}-\sqrt{\frac{D^{2}-w O C^{2}}{4}}
$$

FEEDS \& SPEEDS FOR ALL Tech Line Normal \& Rougher
$R P M=\frac{S F M}{d_{1}} \times 3.82$
IPM $=$ No. of Teeth $\times$ IPT $\times$ RPM

Example - Adjusting SFM and IPT for 1/2" diameter end mill, WOC .050", material 1018

SFM IPT
WOC / $d_{1}=x x \%$
. $050 / .500=10 \%$
WOC = 10\%
SFM $=1350$

WOC 10\%
$10 \%=1.8$ IPT multiplier
IPT $.0026 \times 1.8=.0047$
IPT $=.0047$

| If surface finish is the priority use IPT from table with no adjustment for chip thinning. Use SFM for $10 \%$ radial width of cut. |  |  |  | Surface Feet per Minute - SFM Radial Width of Cut WOC (ae)* |  |  |  |  | Feed Rate Inch per Tooth - IPT |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
